

Activity name: DOCUSOAP

Class: VI

Date: 13.5.22

Description:

There are numerous species around the world that are on the verge of extinction. To create awareness about the dying species, every third Friday in the month of May, National Endangered Species Day is celebrated across the world. Extinction may be caused by different natural elements including catastrophic events, disease, predators, climate change, and competition. But it may be driven by human activity through changes in land use, climate, pollution, hunting, fishing and poaching. A Talk show on the topic endangered species was presented in class on Friday, 13th May. Students participated enthusiastically by presenting their net search and discussing the root cause of human interference with nature.
