

MATHS CLUB

Club Activity: Tangy Tangram

The tangrams are old Chinese puzzles consisting of seven flat polygons, called *tans*, which are put together to form shapes of animals, people and things. They are an excellent tool to teach kids spatial relationships and geometric terms. This simple puzzle enhances their problem-solving abilities and promotes brain development. Besides, they help children improve their logical abilities. During the activity students learnt to make objects like duck, house, a man with an umbrella, a running man etc and enjoyed the activity.
